Project Report on

ANTI-ENIGMA

Submitted in partial fulfillment of the requirements
for the award of the degree of

BACHELOR OF ENGINEERING

COMPUTER SCIENCE AND ENGINEERING

BY

K GOPI KRISHNA(1602-19-733-069)

P ASHISH (1602-19-733-065)

Under the guidance of

B SYAMALA, ASSISTANT PROFESSOR

I NAVAKANTH, ASSISTANT PROFESSOR

Department of Computer Science Engineering

Vasavi College of Engineering

(Affiliated to Osmania University)

Ibrahimbagh, Hyderabad-31 2021

ACKNOWLEDGEMENT

We whole heartedly thank our project guides, **Syamala mam and Navakanth Sir** for their constant support, encouragement, and valuable guidance.

We are grateful to our Head of Department, **Dr. T. Adilakshmi mam**, for her steady support and the provision of every resource required for the completion of this project.

We would like to take this opportunity to thank our Principal, **Dr. S.V. Ramana garu**, as well as the management of the institute, for having designed an excellent learning atmosphere.

ABSTRACT

Something which is mysterious is defined as **enigma**. In 2018, There was a cyber apocalypse which threatened Jeff Bezos, CEO of Amazon. What happened was a small malicious file placed under a media file upon downloading transferred all his data illegally. These kind of acts by hackers place the civilians in peril.

In this regard, our project Anti-Enigma(helps to crack mysterious threats found) aims to develop a small-scale user interface which analyses such malware and take required action to shield the data at utmost level of securities.

INTRODUCTION

a. OBJECTIVE:

The objective of this project is to develop a simple small scale user interface which protects the user from malicious data files by analyzing threats and shielding the users data.

b. OVERVIEW:

The user gets to access the website only through login system and hence credentials. The user can upload the file which seem to be malicious into the drop-down box. The result is displayed on the screen if any threat is found but the details of that particular threats is confidential hence it is emailed or sent as message to private number of the user. All the users data is stored and protected.

c. SCOPE:

This application can be easily implemented under various situations. We can add new features as and when we require. Reusability is possible as and when require in this application. There is flexibility in all the modules.

- **Extensibility:** This software is extendable in ways that its original developers may not expect. The following principles enhances extensibility like hide data structure, avoid traversing multiple links or methods, avoid case statements on object type and distinguish public and private operations.
- **Understandability:** A method is understandable if someone other than the creator of the method can understand the code(as well as the creator after a time lapse). We use the method, which small and coherent helps to accomplish this.

- **Cost- effectiveness:** Its cost is under the budget and make within given time. It is desirable to aim for a system with a minimum cost subject to the condition that it must satisfy the entire requirement.

Scope of this document is to put down the requirements, clearly identifying the information needed by the user, the source of the information and outputs expected from the system.

SRS

A Software Requirements Specification (SRS) is a complete set of information about the system on which the developed project will be running. It includes all the hardware as well as the recommended system requirement for running the software is also mentioned in detail separately. The aim of this document is to gather and analyze and give in-depth insight of the complete software requirement of our project ANTI-ENIGMA.

a Hardware Required:

- Processor: Intel i3 or Above
- RAM: 2GB or above
- Hard Disk: 1 GB or above
- Input Devices: Keyboard, Mouse
- Output Devices: Monitor

b Software Required:

- Operating System: Linux, Ubuntu, Windows 10
- Frontend: HTML, CSS, JavaScript, Bootstrap
- Backend: Python
- Framework: Django
- IDE: Visual Studio Code

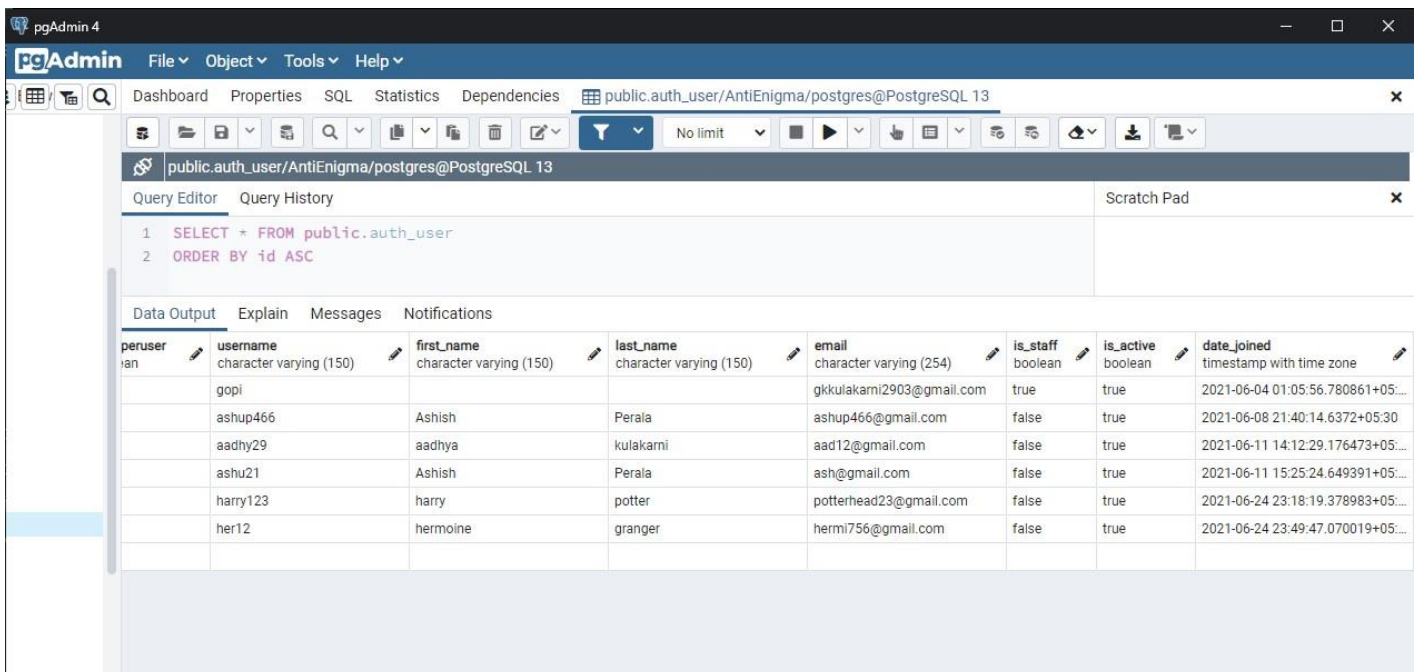

Project Database and Table

Database is critical for all businesses. A good database does not allow any form of anomalies and stores only relevant information in an ordered manner. If a database has anomalies, it is affecting the efficiency and data integrity. This fulfils the last objective of ensuring data are accurate and retrieved correctly.

Database files are the key source of information into the system. The files should be properly designed and planned for collection, accumulation, editing and retrieving the required information. The organization of data in database aims to achieve three major objectives:-

- Data integration
- Data integrity
- Data independence

Here in this project, we used databases for storing login credentials of the user and retrieve them accordingly. We used PostgreSQL and PgAdmin to store the details of the user.

The screenshot shows the pgAdmin 4 web interface. The top navigation bar includes 'File', 'Object', 'Tools', and 'Help'. The main toolbar contains various icons for database operations. The 'Query Editor' tab is active, displaying a SQL query: `1 SELECT * FROM public.auth_user` and `2 ORDER BY id ASC`. Below the query editor, the 'Data Output' tab shows the results of the query in a table format. The table has columns: `peruser`, `username`, `first_name`, `last_name`, `email`, `is_staff`, `is_active`, and `date_joined`. The data is sorted by `id` in ascending order.

| peruser | username | first_name | last_name | email | is_staff | is_active | date_joined |

WHAT ARE WE – WHY US?

Hello, we're Anti-Engima, your new premium encryption-decryption service. We know that it's a matter of privacy and safeguarding your information. Dont worry! We're really good at it, we promise! So just Login, Upload, and Dive into fun!

SAFE AND SECURE

Never doubt us again! We really mean that. Our site is designed to value your safety. You can also save your history if needed and its completely private!..

FAST NETWORK

You're only few seconds away from results. We work with the best algorithms and designs to ensure that you're 100% happy.

PRIVACY

All our intentions in designing this is completely to ensure the privacy of a citizen. We ensure 100% safety to our databases and information stored.

AN UPLOAD THATS IT!

We don't limit your creativity, which means you can upload any picture you doubt, whatever you feel like. We Help you with accurate results. It's up to you!

THEY TRUSTED US - NOW IT'S YOUR TIME

“

Anti-Engima is just awesome! Anti-Engima is a life-saver. Now that I got used to it, I could live happily!

Alberto Duncan

“

Inexpensive, Safe and feels like home. We have lots of sites, but no one comes even close to Anti-Engima. Our Community are so in love!

Joana Silva

“

I was looking for a quick and easy privacy service. I tried a lot of them and ended up with Anti-Engima. Best service in recent times. Keep up the great work!

Milton Chapman

Fig 3 & 4: Features

b. Login Page:

The screenshot shows a web browser window with the URL `127.0.0.1:8000/accounts/register`. The page has a light blue background with a white card containing the registration form. On the left side of the card, the text "BONJOUR!!" is displayed in bold, followed by "Existing User??" and a black "SIGN IN" button. On the right side, the "Create Account" section contains a form with the following fields: Firstname, Lastname, Username, Email, Password, and Confirm Password. A "SIGN UP" button is located at the bottom of the form. The browser's address bar and bookmarks are visible at the top.

Fig 5:user registration

This screenshot shows the same registration page as Figure 5, but with an error message displayed below the "SIGN UP" button: "Username already exists!!". The rest of the page, including the "BONJOUR!!" text, "Existing User??" text, "SIGN IN" button, and the "Create Account" form fields, remains the same. The browser window and address bar are also visible.

Fig 6: username already exists.

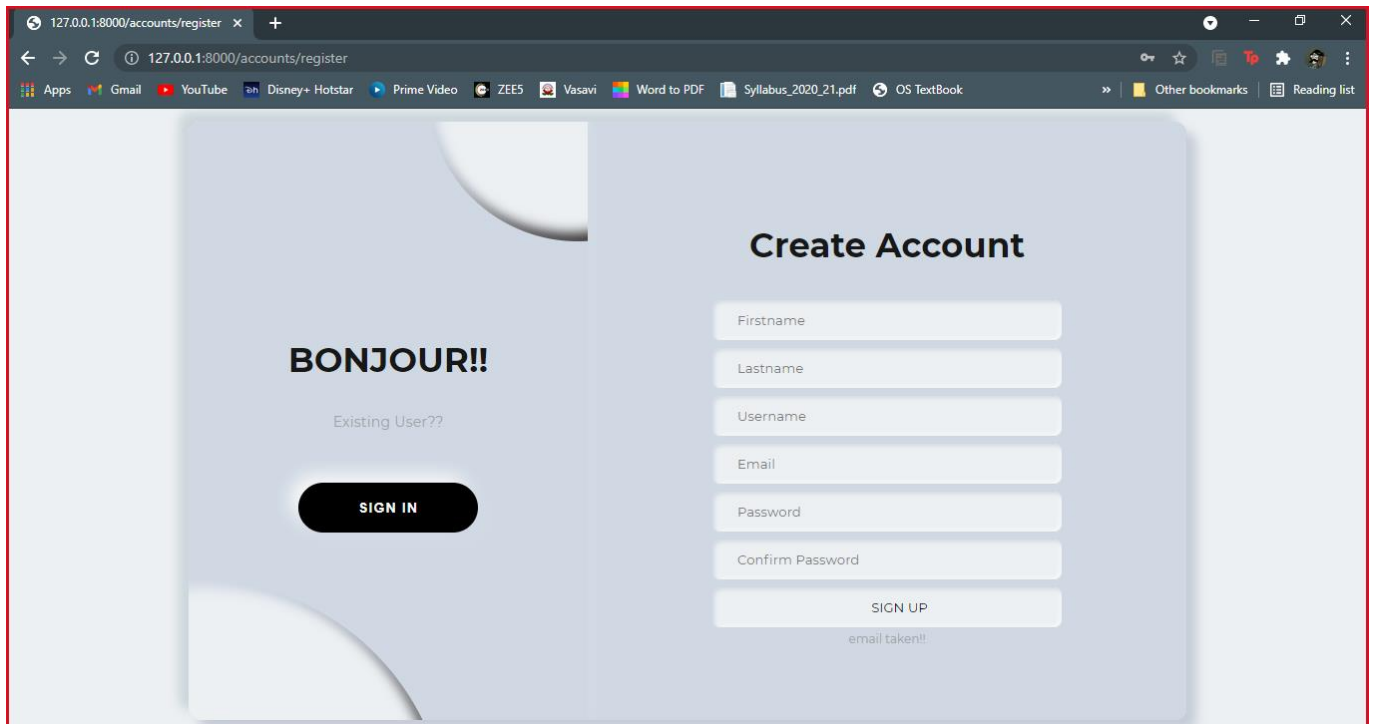

Fig 7 : email taken.

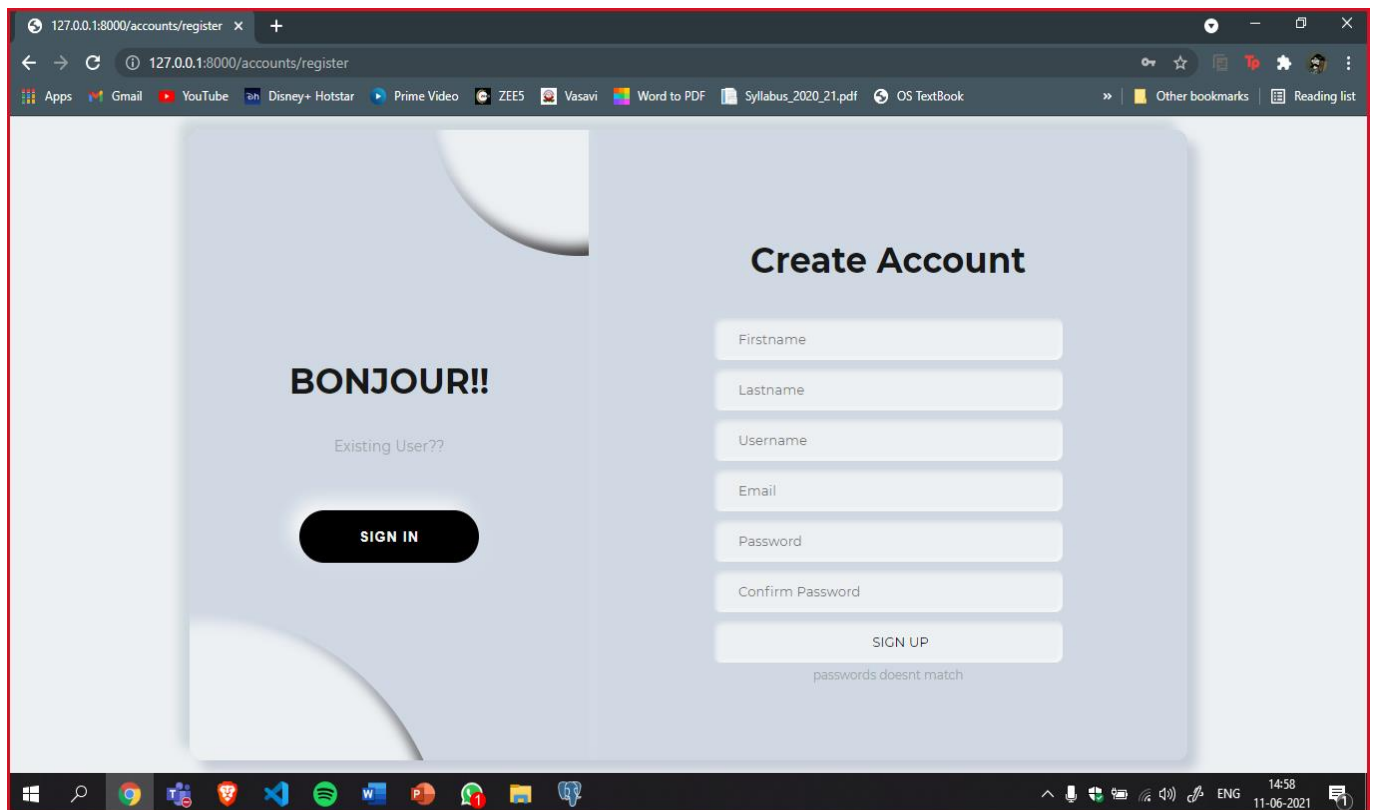

Fig 8: passwords do not match.

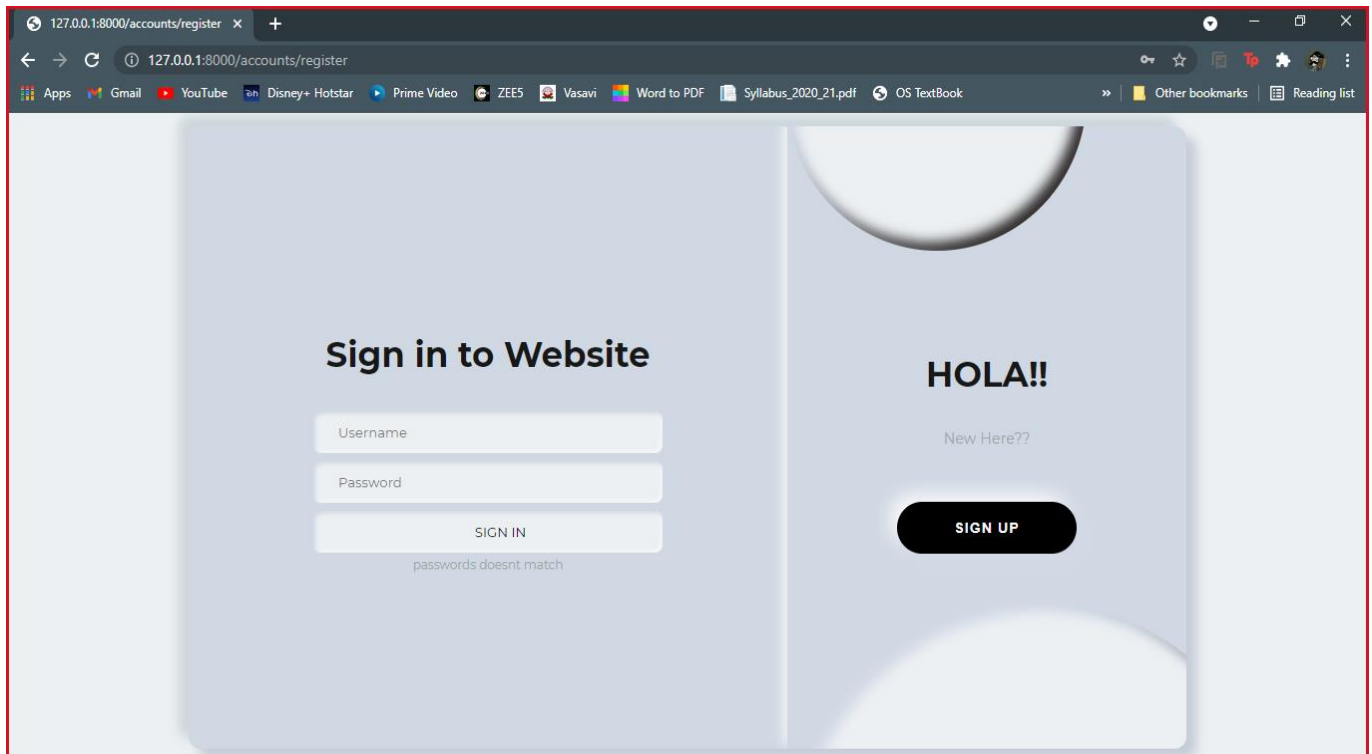

Fig 9: Sign in Page

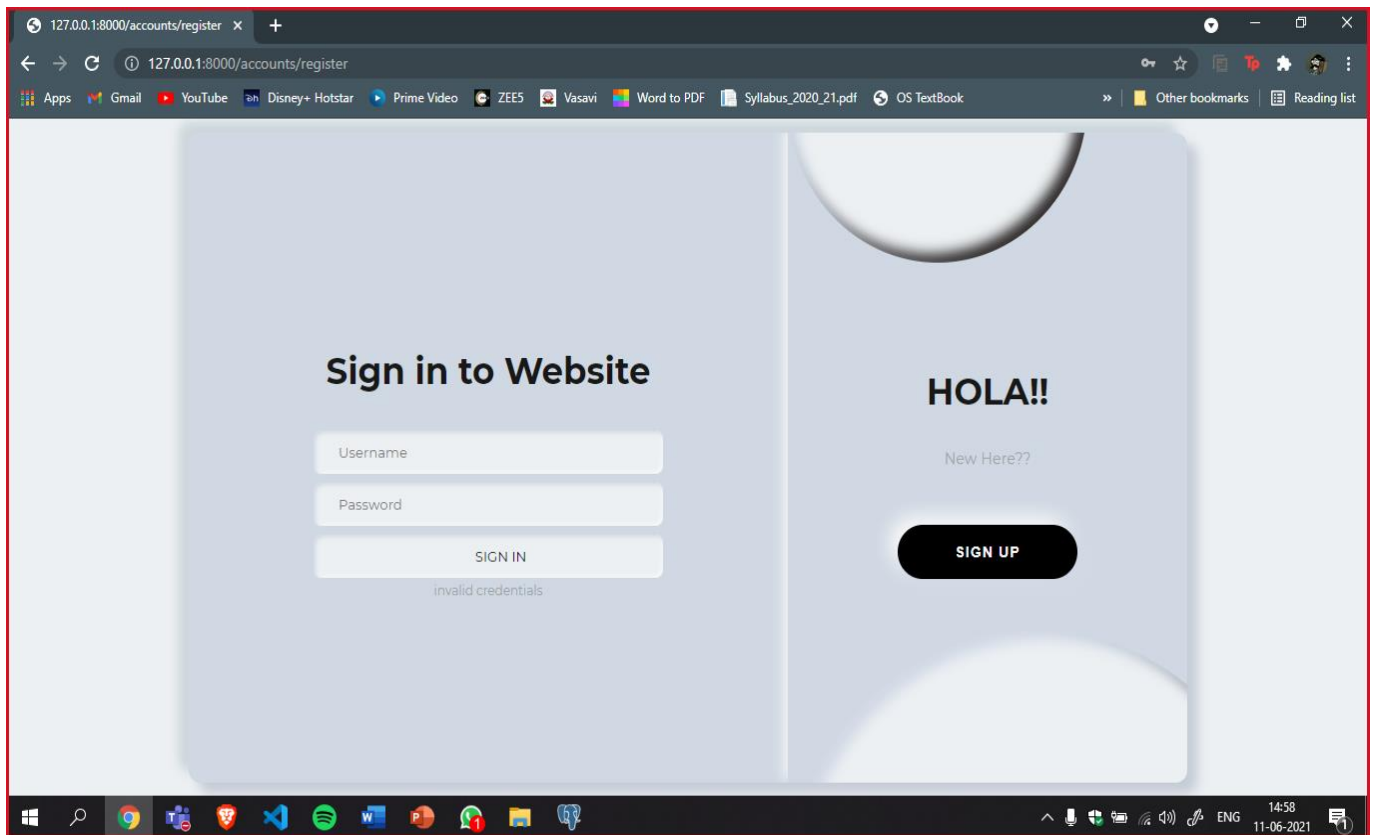

Fig 10 : Invalid Credentials

c. Upload page:

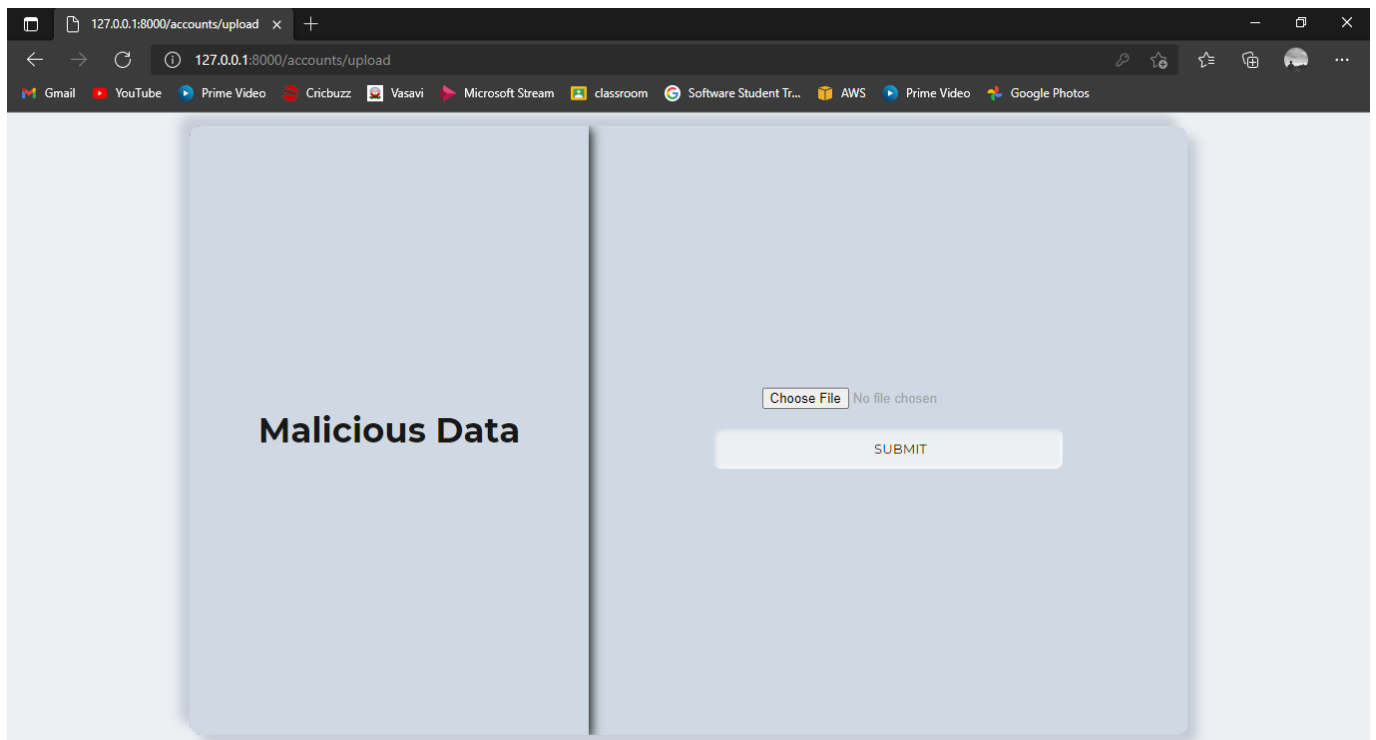

Fig 11 : Upload a file

Fig 12: drop down box opens when we click choose file.

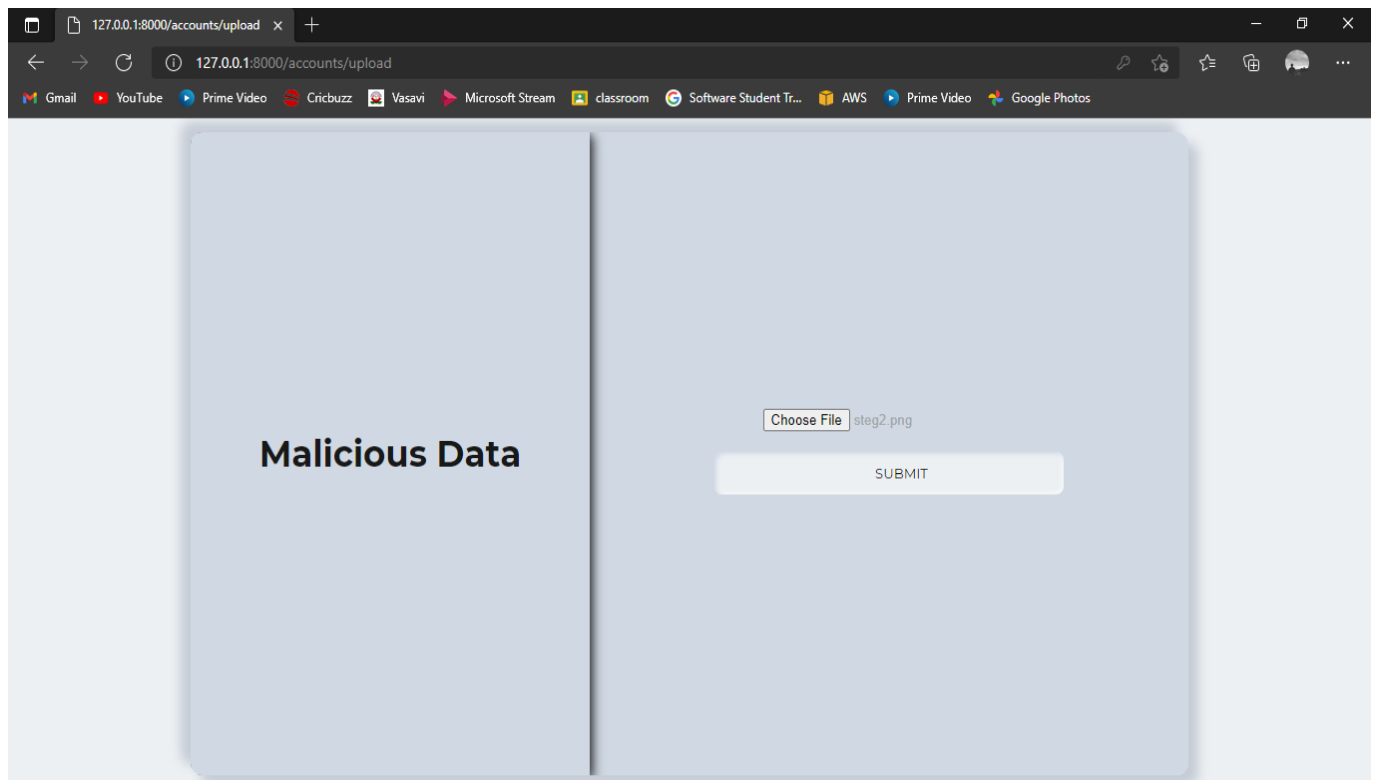

Fig 13 : chosen file with extension is shown.

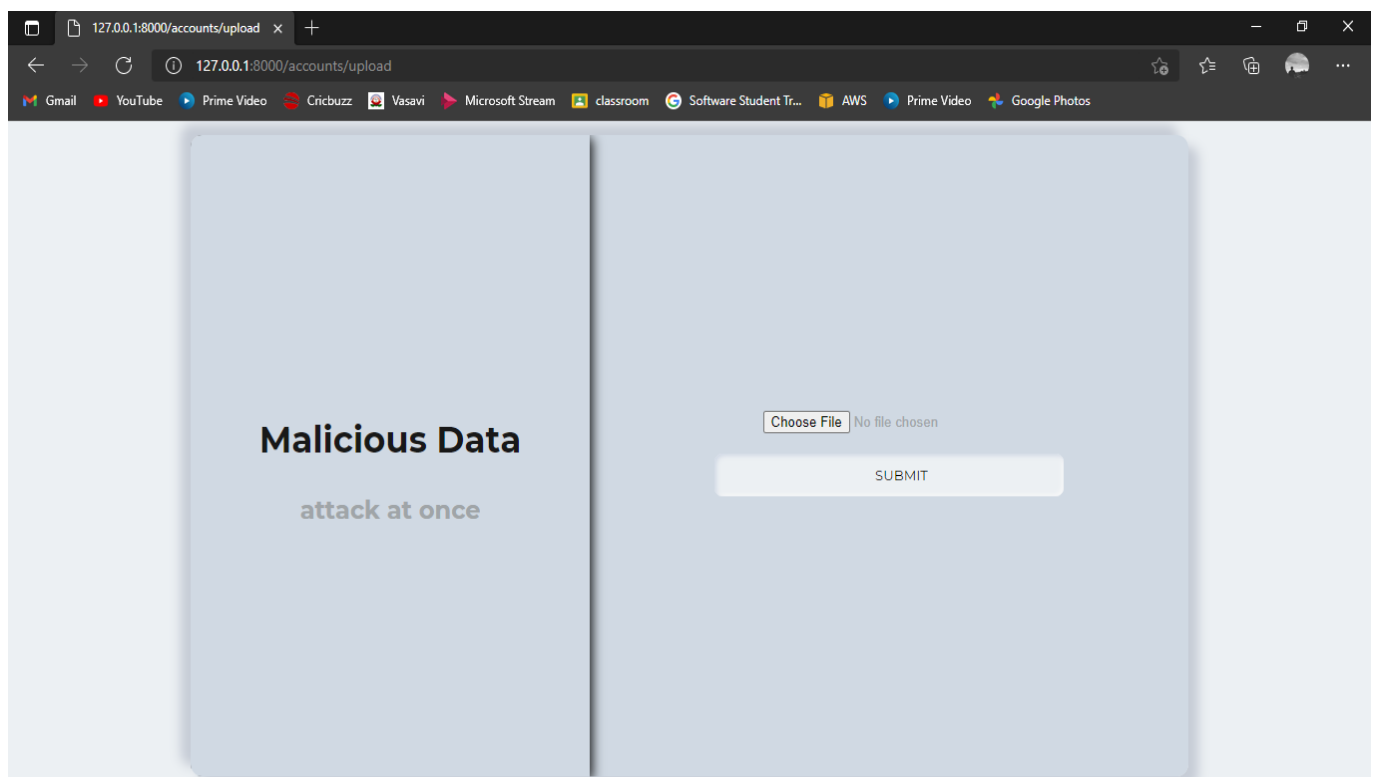

Fig 14 : When clicked on submit, it displays the decoded text present in the file uploaded.

Technologies Used

Tools

- ✓ HTML
- ✓ CSS
- ✓ JavaScript
- ✓ Bootstrap
- ✓ Django
- ✓ PostgreSQL

a. HTML

Every webpage you look at is written in a language called HTML. You can think of HTML as the skeleton that gives every webpage structure. In this course, we'll use HTML to add paragraphs, headings, images and links to a webpage.

In the editor to the right, there's a tab called test.html. This is the file we'll type our HTML into. Like any language, it has its own special syntax. A browser's job is to transform the code in test.html into a recognizable webpage! It knows how to lay out the page by following the HTML syntax.

b. CSS

Cascading Style Sheets (CSS) is a style sheet language used for describing the presentation of a document written in a markup language.[1] Most often used to set the visual style of web pages and user interfaces written in HTML and XHTML, and is applicable to rendering in speech, or on other media. Along with HTML and JavaScript, CSS is a cornerstone technology used by most websites to create visually engaging webpages, user interfaces for web applications, and user interfaces for many mobile applications.

CSS is designed primarily to enable the separation of document content from document presentation, including aspects such as the layout, colors, and fonts.[3] This separation can improve content accessibility, provide more flexibility and control in the specification of presentation characteristics, enable multiple HTML pages to share formatting by specifying the relevant CSS in a separate .CSS file, and reduce complexity and repetition in the structural content.

c. **B**Bootstrap

Bootstrap is a potent front-end framework used to create modern websites and web apps. It's open-source and free to use yet features numerous HTML and CSS templates for UI interface elements such as forms typography, forms, buttons, navigation, and other interface components. Bootstrap also supports JavaScript extensions.

Responsive design makes it possible for a web page or app to detect the visitor's screen size and orientation and automatically adapt the display; accordingly, the mobile first approach assumes that smartphones, tablets and task-specific Mobile apps are employees' primary tools for getting work done and addresses the requirements of those technologies in design.

Bootstrap includes user interface components, layouts, and JS tools along with the framework for implementation. The software is available precompiled or as source code.

d. **django** Django

Django (named after the Django Reinhardt) is a high-level python-based free and open-source web framework that follows the model-view-template (MVT) architectural pattern. It is slightly different from the MVC pattern as it maintains its own conventions, so, the controller is handled by the framework itself. The template is a presentation layer. It is an HTML file mixed with Django Template Language (DTL). The developer provides the model, the view, and the template then maps it to a URL, and finally, Django serves it to the user.

Django can be broken into many components:

Models.py file: This file defines your data model by extending your single line of code into full database tables and add a pre-built administration section to manage content.

Urls.py file: It uses a regular expression to capture URL patterns for processing.

Views.py file: It is the main part of Django. The actual processing happens in view.

When a visitor lands on Django page, first Django checks the URLs pattern you have created and used the information to retrieve the view. After that view processes the request, querying your database if necessary, and passes the requested information to a template.

e. PostgreSQL

PostgreSQL, also known as Postgres, is a free and open-source relational database management system emphasizing extensibility and SQL compliance.

PostgreSQL features transactions with Atomicity, Consistency, Isolation, Durability (ACID) properties, automatically updatable views, materialized views, triggers, foreign keys, and stored procedures. It is designed to handle a range of workloads, from single machines to data warehouses or Web services with many concurrent users. It is the default database for macOS Server and is also available for Windows, Linux, FreeBSD, and OpenBSD.

FUTURE WORK

The project has a very vast scope in future. The project can be implemented on intranet in future. Project can be updated in near future as and when requirement for the same arises, as it is very flexible in terms of expansion. It has a scope to run the entire work in a much better, accurate and error free manner.

The following are the future scope for the project.

- ✓ To enable more privacy facial recognition could be added.
- ✓ Mobile app can also be developed using Kivy Framework.
- ✓ We can also ensure to send emails and messages to the mobile instead of displaying the text on screen.

CONCLUSION

In conclusion, our interface provides high privacy for the users accessing and check them whenever they need to access it. The users can find malicious files and easily remove them if threat is found. In addition, it ensures to keep the data safe and protects the user from cyber threats.
